1 Number theory

1.1 Count primes up to N

```
// To initialize, call init_count_primes() first.
// Function count_primes(N) will compute the number of prime numbers lower than
// or equal to N.
//
// Time complexity: Around O(N ^ 0.75)
//
// Constants to configure:
// - MAX is the maximum value of sqrt(N) + 2
bool prime[MAX];
int prec[MAX];
vector<int> P;
llint rec(llint N, int K) {
    if (N <= 1 || K < 0) return 0;
    if (N <= P[K]) return N-1;

    if (N < MAX && llint(P[K])*P[K] > N) return N-1 - prec[N] + prec[P[K]];
    const int LIM = 250;
    static int memo[LIM*LIM][LIM];
    bool ok = N < LIM*LIM;
    if (ok && memo[N][K]) return memo[N][K];
    llint ret = N/P[K] - rec(N/P[K], K-1) + rec(N, K-1);
    if (ok) memo[N][K] = ret;
    return ret;
}
llint count_primes(llint N) {
    if (N < MAX) return prec[N];
    int K = prec[(int)sqrt(N) + 1];
    return N-1 - rec(N, K) + prec[P[K]];
}
void init_count_primes() {
    prime[2] = true;
    for (int i = 3; i < MAX; i += 2) prime[i] = true;
    for (int i = 3; i*i < MAX; i += 2) if (prime[i])
        for (int j = i*i; j < MAX; j += i+i)
            prime[j] = false;
    REP(i, MAX) if (prime[i]) P.push_back(i);
    FOR(i, 1, MAX) prec[i] = prec[i-1] + prime[i];
}
```

1.2 Extended Euclide

```
int bezout(int a, int b) {
    // return x such that ax + by == gcd(a, b)
    int xa = 1, xb = 0;
    while (b) {
        int q = a / b;
        int r = a - q * b, xr = xa - q * xb;
        a = b; xa = xb;
        b = r; xb = xr;
    }
    return xa;
}

pair<int, int> solve(int a, int b, int c) {
    // solve ax + by == c
    int d = __gcd(a, b);
    int x = bezout(a, b);
    int y = (d - a * x) / b;
    c /= d;
    return make_pair(x * c, y * c);
}

int main() {
    int a = 100, b = 128;
    int c = __gcd(a, b);
    int x = bezout(a, b);
    int y = (c - a * x) / b;
    cout << x << ' ' << y << endl;
    pair<int, int> xy = solve(100, 128, 40);
    cout << xy.first << ' ' << xy.second << endl;
    return 0;
}
```

1.3 System of linear equations

```
// extended version, uses diophantine equation solver to solve system of congruent equations
pair<int, int> solve(int a, int b, int c) {
    int cc = c;
    // solve ax + by == c
    int d = __gcd(a, b);
    int x = bezout(a / d, b / d);
